Logistic Regression with Undersampling

Importing important libraries and modules.

In [1]:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.model_selection import KFold, cross_val_score
from sklearn.metrics import confusion_matrix
import itertools
from sklearn.metrics import accuracy_score
%matplotlib inline
```

Defining the utility function called plot_confusion_matrix for displaying the confusion matrix in a nice UI.

In [2]:

```
def plot_confusion_matrix(cm, classes, normalize=False, title='Confusion ma
trix', cmap=plt.cm.Blues):
    plt.imshow(cm, interpolation='nearest', cmap=cmap)
    plt.title(title)
    plt.colorbar()
    tick_marks = np.arange(len(classes))
    plt.xticks(tick_marks, classes, rotation=45)
    plt.yticks(tick_marks, classes)
    thresh = cm.max() / 2.
    for i, j in itertools.product(range(cm.shape[0]), range(cm.shape[1])):
        plt.text(j, i, cm[i, j], horizontalalignment="center", color="white"
if cm[i, j] > thresh else "black")
    plt.tight_layout()
    plt.ylabel('True label')
    plt.xlabel('Predicted label')
    plt.show()
```

Defining the utility function called show_data for displaying precision, recall and accuracy from the confusion matrix.

In [3]:

```
def show_data(cm, print_res = 0):
    tp = cm[1,1]
    fn = cm[1,0]
    fp = cm[0,1]
    tn = cm[0,0]
    if print_res == 1:
        print('Precision =     {:.3f}'.format(tp/(tp+fp)))
```

```
        print('Recall (TPR) =  {:.3f}'.format(tp/(tp+fn)))
        print('Accuracy =  {:.3f}'.format((tp+tn)/(tp+tn+fp+fn)))
    return tp/(tp+fp), tp/(tp+fn)
```

Loading data from csv file to the dataframe.

In [4]:

```
data = pd.read_csv('F:\RIT\Sem 2\AT\dataset_backup\creditcard.csv')
print(data.shape)
```

```
(284807, 31)
```

Separating features from class variables.

In [5]:

```
X = data.ix[:, data.columns != 'Class']
y = data.ix[:, data.columns == 'Class']
print(X.shape)
print(y.shape)
```

```
(284807, 30)
(284807, 1)
```

Extracting fraud data. Also making the undersampled subdataset with entire population of fraud class and same number of non fraud class instances in the undersampled subdataset.

In [6]:

```
number_records_fraud = len(data[data.Class == 1])
fraud_record = data[data.Class == 1]
y_fraud_record = fraud_record.ix[:, fraud_record.columns == 'Class']
X_fraud_record = fraud_record.ix[:, fraud_record.columns != 'Class']

fraud_indices = np.array(data[data.Class == 1].index)
normal_indices = data[data.Class == 0].index

# Out of the indices we picked, randomly select "x" number
(number_records_fraud)
random_normal_indices = np.random.choice(normal_indices,
number_records_fraud, replace = False)
random_normal_indices = np.array(random_normal_indices)

# Appending the 2 indices
under_sample_indices = np.concatenate([fraud_indices,random_normal_indices]
)

# Under sample dataset
under_sample_data = data.iloc[under_sample_indices,:]

X_undersample = under_sample_data.ix[:, under_sample_data.columns != 'Class
']
y_undersample = under_sample_data.ix[:, under_sample_data.columns == 'Class
']

print("Percentage of normal transactions: ", len(under_sample_data[under_sa
mple_data.Class == 0])/len(under_sample_data))
print("Percentage of fraud transactions: ", len(under_sample_data[under_sam
```

```
ple_data.Class == 1])/len(under_sample_data))
print("Total number of transactions in resampled data: ",
len(under_sample_data))
```

```
Percentage of normal transactions:  0.5
Percentage of fraud transactions:  0.5
Total number of transactions in resampled data:  984
```

Splitting training and test data from undersampled subdataset.

In [7]:

```
# Whole dataset
#X_train, X_test, y_train, y_test = train_test_split(X, y, test_size =
0.3, random_state = 0)

#print("Number transactions train dataset: ", len(X_train))
#print("Number transactions test dataset: ", len(X_test))
#print("Total number of transactions: ", len(X_train) + len(X_test))

# Undersampled dataset
X_train_undersample, X_test_undersample, y_train_undersample,
y_test_undersample = train_test_split(X_undersample ,y_undersample ,test_si
ze = 0.3 ,random_state = 0)
print("")
print("Number transactions train dataset: ", len(X_train_undersample))
print("Number transactions test dataset: ", len(X_test_undersample))
print("Total number of transactions: ", len(X_train_undersample) + len(X_te
st_undersample))
```

```
Number transactions train dataset:  688
Number transactions test dataset:  296
Total number of transactions:  984
```

Training the model and applying the model on test data and ploting the congusion matrix.

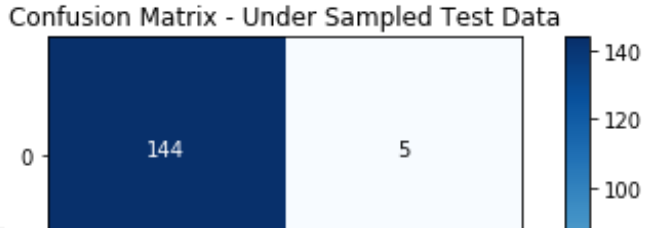
In [8]:

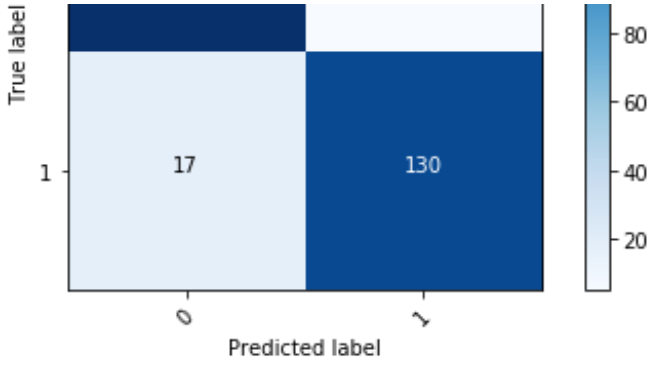
```
lr = LogisticRegression(C = 0.01, penalty = 'l2')
lr.fit(X_train_undersample, y_train_undersample.values.ravel())
y_pred_undersample = lr.predict(X_test_undersample.values)

cnf_matrix = confusion_matrix(y_test_undersample,y_pred_undersample)
np.set_printoptions(precision=2)

print(cnf_matrix)
plot_confusion_matrix(cnf_matrix, ['0', '1'], title = 'Confusion Matrix - U
nder Sampled Test Data')
pr, tpr = show_data(cnf_matrix, print_res = 1);
```

```
[[144   5]
 [ 17 130]]
```





```
Precision =      0.963
Recall (TPR) =   0.884
Accuracy =   0.926
```

Applying the model on fraud data only and ploting the congusion matrix.

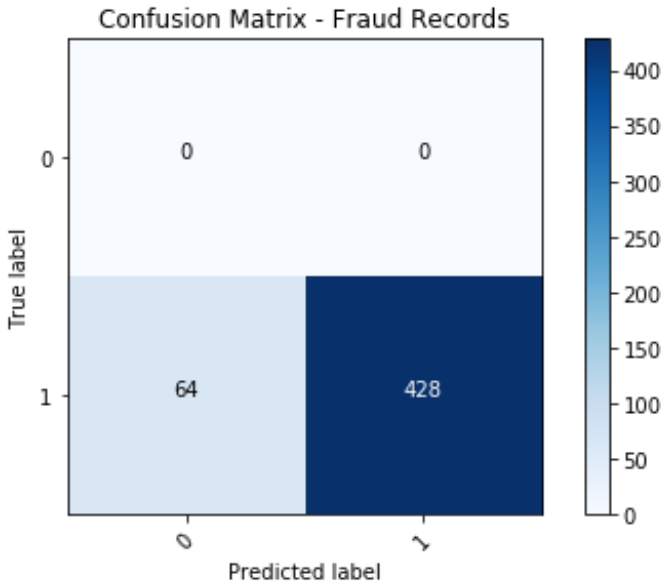
In [9]:

```
#lr = LogisticRegression(C = 0.01, penalty = 'l2')
#lr.fit(X_train_undersample, y_train_undersample.values.ravel())
y_pred_fraud_record = lr.predict(X_fraud_record.values)

cnf_matrix = confusion_matrix(y_fraud_record, y_pred_fraud_record)
np.set_printoptions(precision=2)

print(cnf_matrix)
plot_confusion_matrix(cnf_matrix, ['0', '1'], title = 'Confusion Matrix - F
raud Records')
pr, tpr = show_data(cnf_matrix, print_res = 1);
```

```
[[  0   0]
 [ 64 428]]
```



```
Precision =      1.000
Recall (TPR) =   0.870
Accuracy =   0.870
```

Applying the model on entire dataset and plotting the confusion matrix.

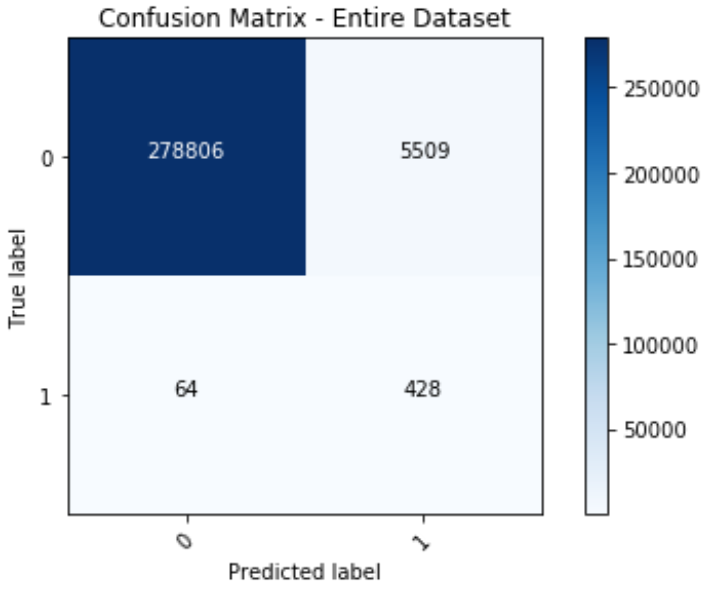
In [10]:

```
#lr = LogisticRegression(C = 0.01, penalty = 'l2')
#lr.fit(X_train_undersample, y_train_undersample.values.ravel())
y_pred_all = lr.predict(X.values)

cnf_matrix = confusion_matrix(y, y_pred_all)
np.set_printoptions(precision=2)

print(cnf_matrix)
plot_confusion_matrix(cnf_matrix, ['0', '1'], title = 'Confusion Matrix - E
ntire Dataset')
pr, tpr = show_data(cnf_matrix, print_res = 1);
```

```
[[278806   5509]
 [    64    428]]
```



```
Precision =     0.072
Recall (TPR) =  0.870
Accuracy =  0.980
```
